**Subject:** RE: Public comment on Valero crude-by-rail project

Principal Planner, Benicia Community Development Department Amy Million,

Dear Mrs. Million,

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

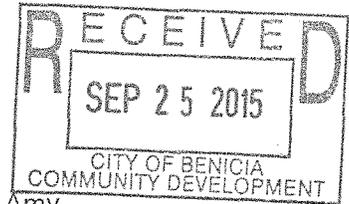

Sincerely,

Jay Carmona  
317 Hanover Ave Apt 108  
Oakland, California 94606

Principal Planner, Benicia Community Development Department Amy  
Million,

Dear Mrs. Million,

Oil trains pose a great potential danger to the community of Benicia. Therefore, I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate that community.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

Of equal concern is the fact that bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. Million,

Dear Mrs. Million,

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

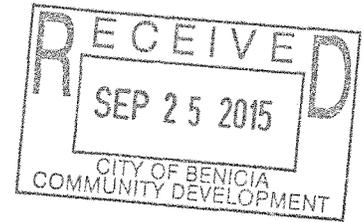

Sincerely,

Howard Cohen  
3272 Cowper Street  
Palo Alto, California 94306

Principal Planner, Benicia Community Development Department Amy  
Million,

Dear Mrs. Million,

I am yet another Californian deeply concerned about permitting oil trains to traverse our state. You have no doubt already heard all the good arguments against the encouragement of more fossil fuel burning, and about the dangers that oil trains pose to our environment (every living thing near the refinery and their routes). So I'm simply adding my voice in agreement that there is no place in our state for further fossil fuel expansion.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

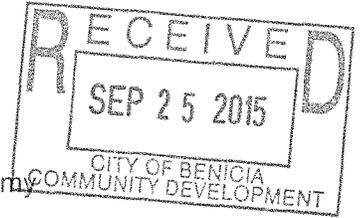

Sincerely,

Jacquie Lowell  
3766 Southview Drive #250  
San Diego, California 92117-5338

Principal Planner, Benicia Community Development Department Amy  
Million,

Dear Mrs. Million,

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

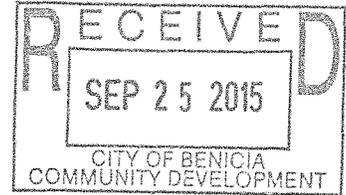

Sincerely,

Carlotta Tiniakoff  
PO Box 1799  
La Mirada, California 90637

Principal Planner, Benicia Community Development Department Amy Million,

Dear Mrs. Million,

It is time California led the nation in getting off fossil fuels. A great start is by not allowing oil trains to travel anywhere that California families reside. I am deeply concerned over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

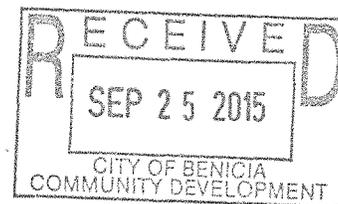

Sincerely,

Thomas Snell  
860 Pinetree Ln  
Aptos, California 95003

Principal Planner, Benicia Community Development Department Amy Million,

Dear Mrs. Million,

Should Valero get its way, oil trains carrying explosive and toxic extreme crude will travel daily through Northern California - including right behind California's state capitol building - en route to the Benicia refinery. The project's environmental review even admits that impacts from "hazardous materials" will be "significant and unavoidable." This risk is unacceptable.

Million,

Dear Mrs. Million,

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

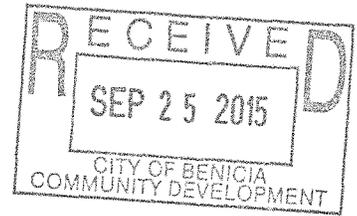

Sincerely,

Joel Meza  
P. O. Box 210144  
San Francisco, California 94121

**Subject:** RE: Public comment on Valero crude-by-rail project

Principal Planner, Benicia Community Development Department Amy Million,

Dear Mrs. Million,

I'm pretty sure you know that 'worst case scenarios' are rarely what happen - that what happens is usually far worse than anything imagined... Please care for the people of your community by rejecting Valero's proposed oil train terminal.

For all the reasons articulated below I urge you to recognize that the highest value is supporting all life, not corporations and their economic projections.

According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec

in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

Principal Planner, Benicia Community Development Department Amy Million,

Dear Mrs. Million,

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

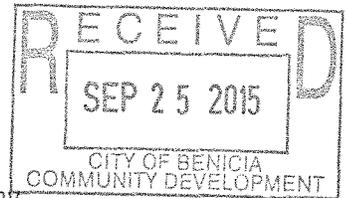

Sincerely,

Kristina Bennett  
980 Bush St. #206  
San Francisco, California 94109

You don't have to be a retired environmental planner like myself to realize the potential detrimental adverse effects of the oil train project even at a minimal accident scenario. It's a "no project" alternative because these problems cannot be mitigated merely by imposing conditions.

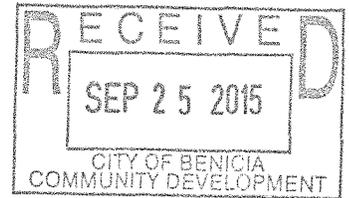

Sincerely,

Barry Katz

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

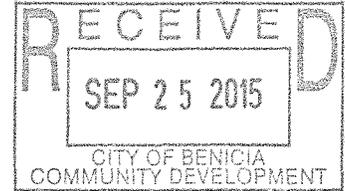

Sincerely,

Suzanne Sutton  
3 calle del Onda  
Stinson Beach, 94970

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

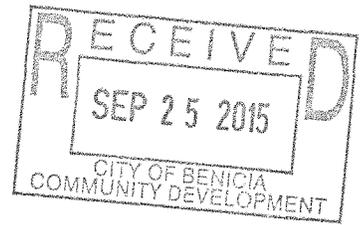

Sincerely,

Arthur Delgadillo

Principal Planner, Benicia Community Development Department Amy Million,

Dear Mrs. Million,

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. **Sent:** Friday, September 25, 2015 7:17 AM  
**To:** Amy Million  
**Subject:** RE: Public comment on Valero crude-by-rail project

Principal Planner, Benicia Community Development Department Amy Million,

Dear Mrs. Million,

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts"...

Well, they ARE avoidable. Just say NO.

Allowing expansion of Big Oil will just encourage further and more dangerous corporate behaviors including fracking and the rampant disregard for regulation and life that led to disasters such as the Deepwater Horizon explosion.

Put people over short-term profits.

We don't need the polluted air and cast-off chemicals from oil cars poisoning our communities.

We don't want our coasts dug up for more ports to export oil which will only serve to INCREASE costs within California.

We don't want more global warming.

We don't want our tax dollars used to clean up the mess of spills and other 'accidents' caused by corporate cost-cutting.

Some people are squawking about the cost? That development helps the economy. Well, who's economy? The one most of us live in or the 1%?

What about the cost of cleaning up after major spills? The medical costs and settlements that will come if you let this continue??

Who pays for that?

Solar energy is now CHEAPER than fossil fuels in most areas if you remove the corporate welfare benefits Big Oil and Big Coal have been rolling in for generations, and green energy provides many multiples of stable career-oriented jobs instead of the short term minimum wage labor the fossil fuel industry promotes.

This EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. I lived for 3 years and went to university 50 miles from Lac-Mégantic, Québec where in July 2013 a train spilled over 1.6 million gallons of crude from the US Bakkan oil fields, about SIXTY tanker cars full, and murdered 47 people and destroyed half the downtown. What would happen in Benicia?

At a time when wildfires are raging and the drought is more dire than ever, an oil train event could precipitate a holocaust and wipe Benicia off the map, killing many of its inhabitants, especially children and the elderly who are harder to evacuate and more susceptible to the chemical fumes of such a conflagration.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to NOT certify this EIR and reject Valero's proposed oil train terminal in Benicia.

Valero should be investing in green energy and creating good jobs instead of promulgating the destruction of our environment with infrastructure that will be useless within a decade or so, leading to industrial wastelands across the state and country.

Sincerely,

Liz Amsden

The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

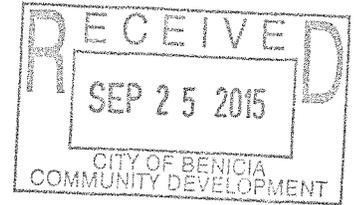

Sincerely,

Dennis Presson  
1560 Sacramento St. Apt. C

Principal Planner, Benicia Community Development Department Amy  
Million,

Dear Mrs. Million,

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

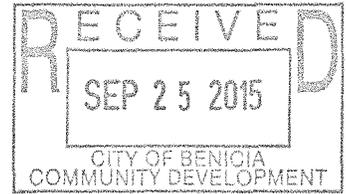

Sincerely,

Barbara Frances  
399 Carpentaria Road  
Aromas, California 95004

Principal Planner, Benicia Community Development Department Amy Million,

Dear Mrs. Million,

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

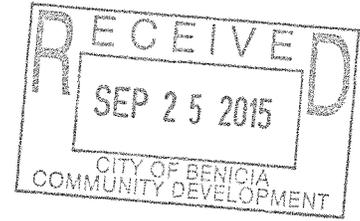

Sincerely,

ruth valdez

Principal Planner, Benicia Community Development Department Amy Million,

Dear Mrs. Million,

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

**Subject:** RE: Public comment on Valero crude-by-rail project

Principal Planner, Benicia Community Development Department Amy Million,

Dear Mrs. Million,

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

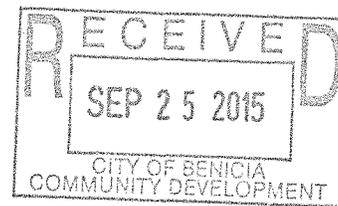

Sincerely,

Bruce McGraw  
3624 Grim Ave.  
San Diego, California 92104

Also, for the most part that refined oil is destined for export. So residents living along the route, planned is that the trains go through some of the densest populated areas in the state, are asked to carry all the risks for the benefit of energy users abroad....

**Subject:** RE: Public comment on Valero crude-by-rail project

Principal Planner, Benicia Community Development Department Amy Million,

Dear Mrs. Million,

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

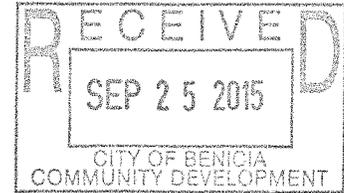

Sincerely,

Jared Sacco  
1074 Dylan Ct.  
Mckinleyville, California 95519

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

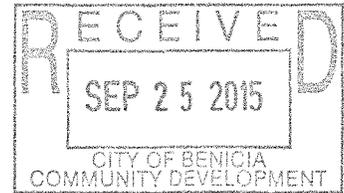

Sincerely,

Marinell Daniel  
4070 La Colina Rd.  
El Sobrante, California 94803

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

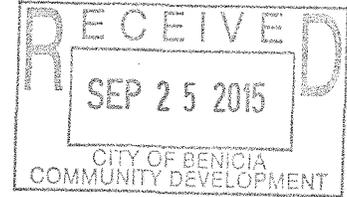

Sincerely,

Tim Taylor  
2330 Camden Ave.  
Los Angeles, California 90064

Principal Planner, Benicia Community Development Department Amy Million,

Dear Mrs. Million,

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

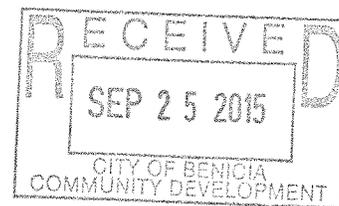

Sincerely,

Karen Kirschling  
633 Oak  
SF, California 94117

Principal Planner, Benicia Community Development Department Amy Million,

Dear Mrs. Million,

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. **Subject:** RE: Public comment on Valero crude-by-rail project

Principal Planner, Benicia Community Development Department Amy Million,

Dear Mrs. Million,

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

I live with 75 other seniors in an apartment complex perhaps fifty yards from the railroad tracks in Dixon. There is an elementary school a block away. If an accident were to occur, we would all certainly be killed in a horrible way. I do not wish to be "collateral damage" so that others can make a larger profit.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also totally unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project cannot be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

Sincerely,

Laura Overmann  
508 El Camino Real #4  
Burlingame, California 94010-5141

Principal Planner, Benicia Community Development Department Amy Million,

Dear Mrs. Million,

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

Sincerely,

David Grothey  
1869 Scenic View Place  
Alpine, California 91901

Principal Planner, Benicia Community Development Department Amy Million,

Dear Mrs. Million,

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

**Subject:** RE: Public comment on Valero crude-by-rail project

Principal Planner, Benicia Community Development Department Amy Million,

Dear Mrs. Million,

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

Sincerely,

Michael Karsh  
275 Brady Ct.  
Martinez, California 94553

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

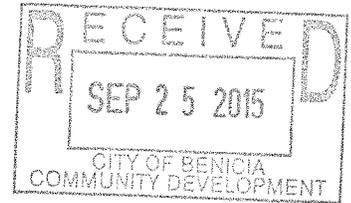

Sincerely,

Jim Petkiewicz  
916 Wren Drive  
San Jose, California 95125

Principal Planner, Benicia Community Development Department Amy  
Million,

Dear Mrs. Million,

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

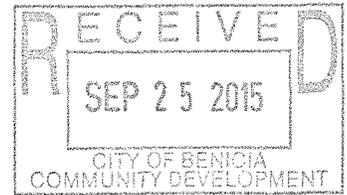

Sincerely,

Barbara Kennedy

The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

Sincerely,

Jennifer Toth  
19842 Holly Drive  
Santa Clarita, California 91350

Principal Planner, Benicia Community Development Department Amy  
Million,

Dear Mrs. Million,

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

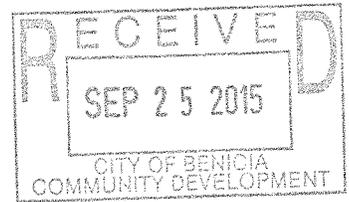

Sincerely,

marjorie xavier

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

Sincerely,

Tanya Rincon

Dear Mrs. Million,

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

Sincerely,

Robert Burk  
611 Woodruff Ave.  
Los Angeles, California 90024

**Sent:** Saturday, September 26, 2015 4:38 AM  
**To:** Amy Million  
**Subject:** RE: Public comment on Valero crude-by-rail project

Principal Planner, Benicia Community Development Department Amy Million,

Dear Mrs. Million,

Please put a stop to Valero's proposed oil train offloading facility in Benicia. It is destructive to our environment, dangerous to public safety and will perpetuate our addiction to oil and climate change.

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. This may even underestimate the risk since the EIR must assume a worst case scenario that reflects existing data on recent spills.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

Dear Mrs. Million,

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

Sincerely,

Ann Sullivan  
11275 Manzanita Road  
Lakeside, California 92040

Dear Mrs. Million,

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

Sincerely,

Emily Bryant

Principal Planner, Benicia Community Development Department Amy Million,

Dear Mrs. Million,

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

Sincerely, Susan P. Walp

Principal Planner, Benicia Community Development Department Amy Million,

Dear Mrs. Million,

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

Sincerely,

dobby sommer

Principal Planner, Benicia Community Development Department Amy Million,

Dear Mrs. Million,

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

Sincerely,

Edward Costello  
620 E Channel Rd  
Santa Monica, California 90402

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

Sincerely,

Wendy Roberts  
977 Verona Avenue  
Livermore, California 94550

Principal Planner, Benicia Community Development Department Amy Million,

Dear Mrs. Million,

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

Sincerely,

David Woodland  
3 Embarcadero West #147  
Oakland, California 94607

Principal Planner, Benicia Community Development Department Amy Million,

Dear Mrs. Million,

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

Sincerely,

Ed Noonan  
307 Daybreak Ct.  
San Ramon, California 94583

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

Sincerely,

Michael Handforth

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

This is an accident waiting to happen.

Sincerely,

ken stack

Principal Planner, Benicia Community Development Department Amy Million,

Dear Mrs. Million,

As a pediatrician I am seriously concerned about exposure of children to toxic and poisonous chemicals in the air they breathe. They are much more sensitive than adults, with significant long-term problems.

Oil trains should not come into our state.

Thus, I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

**Subject:** RE: Public comment on Valero crude-by-rail project

Principal Planner, Benicia Community Development Department Amy Million,

Dear Mrs. Million,

I am profoundly concerned about the safety of Californians, both immediately in regard to the risks of fires and explosions from oil trains and in the long term in regard to the flooding, drought, and wild fires from global climate chaos. So I am writing to object to Valero's proposed oil train offloading facility in Benicia.

According to the EIR for this project, it would create several "significant and unavoidable impacts" that could devastate my state.

As locals in the Benicia area, I imagine you are even more concerned than I about the hazards of bringing oil trains into Benicia. To do so will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery -- and already subject to disproportionate environmental toxins.

The EIR identifies several significant and unavoidable risks from the proposal. There are the air impacts -- from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene. Also, according to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars.

Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable. The EIR assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. However, the train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars!

Shouldn't the EIR assume a worst case scenario, reflecting existing data on recent spills? Without an accurate worst case scenario analysis, this project can not be approved.

Additionally, the revised EIR identifies issues that affect the entire state of California -- and the world: "significant and unavoidable" climate impacts (that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050). At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

Sincerely,

Darien De Lu  
3709 Miller Way  
Sacramento, California 95817

Principal Planner, Benicia Community Development Department Amy Million,

Dear Mrs. Million,

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

Sincerely,

Marjorie Moss  
2736 Caminito San Pablo  
Del Mar, California 92014-3823

Principal Planner, Benicia Community Development Department Amy Million,

Dear Mrs. Million,

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

Sincerely,

Vance Lausmann  
31475 San Ardo Ave  
Cathedral Cty, California 92234-3046

Principal Planner, Benicia Community Development Department Amy Million,

Dear Mrs. Million,

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

Sincerely,

Charlene Root  
8634 Friends Avenue  
Whittier, California 90602

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

Sincerely,

Denise Janssen Eager  
2527 N. Whitewater Club Drive, #D

**To:** Amy Million  
**Subject:** RE: Public comment on Valero crude-by-rail project

Principal Planner, Benicia Community Development Department Amy Million,

Dear Mrs. Million,

As a citizen living along the train route and as a candidate for State Senate representing a district with a million residents, many right along the route from Van Nuys to Moorpark, I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community of Chatsworth and the 27th State Senate district.

Southern California is united in opposition to this project. We don't want these trains coming through our neighborhoods. The Los Angeles City Council is the largest of the many governments that have called for rejecting the project. The Los Angeles County Democratic Party, the Democratic Party of the San Fernando Valley, and many local clubs in my district have made similar calls.

Chatsworth had a terrible train accident a few years ago right next to many homes. What would that accident have looked like if an oil train had been involved?

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

Sincerely,

Laura Herndon  
3311 W. Alameda Ave #F  
Burbank, California 91505

**Subject:** RE: Public comment on Valero crude-by-rail project

Principal Planner, Benicia Community Development Department Amy Million,

Dear Mrs. Million,

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. My family lives near the tracks through the Feather River Canyon, one of the most dangerous stretches of track in the country. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community and much of Butte County, plus many other counties along the tracks. Emergency services have publicly stated they are NOT prepared to handle a derailment of explosive and toxic oil crude. Water supplies for 22 million Californians are at risk of contamination.

Bringing oil trains into Benicia will create unacceptable increases in toxic air and water pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

I live inside the blast zone and have seen these 100 unit trains roll by my home and through the Feather River Canyon. The Feather River is the source for Lake Oroville, California's second largest domestic water supply to 25 million residents. We just had a train derailment on Nov 24, 2014 and would have been a disaster if it would have been a crude oil unit train.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

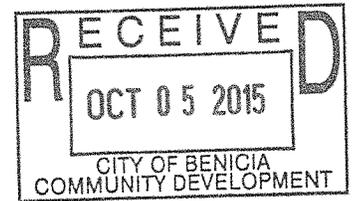

Sincerely,

Felipe Garcia

Principal Planner, Benicia Community Development Department Amy Million,

Dear Mrs. Million,

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

Sincerely,

Barbara Lowden  
9702 Rosemary Drive  
Cypress, California 90630-4043

**To:** Amy Million  
**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

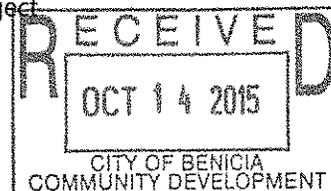

Sincerely,

Adrienne Jacoby

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

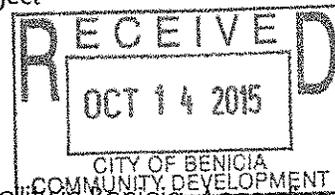

Sincerely,

Debra Polansky

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

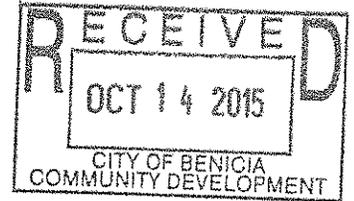

Sincerely,

Jessica Nadolski  
8741 Palmerson Drive  
Antelope, CA 95843

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

Sincerely,

Jane Koski

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

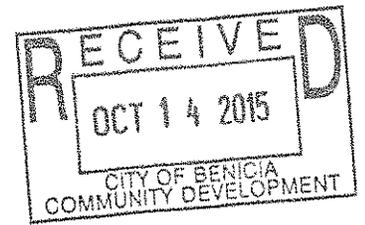

Sincerely,

christopher russell

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

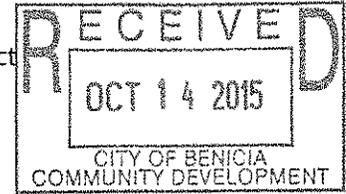

Sincerely,

Debbie Williamson  
PO Box 21  
Mountain Home, AR 72654

**From:** Maureen Oshea <moshea483@yahoo.com>  
**Sent:** Friday, October 09, 2015 3:56 PM  
**To:** Amy Million  
**Subject:** RE: Public comment on Valero crude-by-rail project

Principal Planner, Benicia Community Development Department Amy Million,

Dear Mrs. Million,

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

Sincerely,

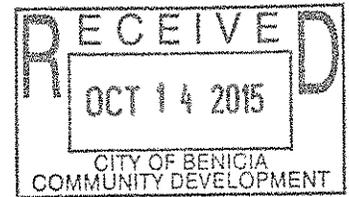

Maureen Oshea

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

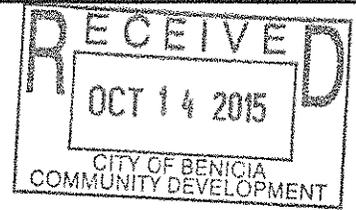

Sincerely,

Anne Smith

**Subject:** I you care about the future of Benicia, Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

As a local business owner, I have to let you know that last year I decided NOT to move my business to Benicia, because I was afraid that this would happen. I had considered moving my business from Vallejo to Benicia, but after hearing that this train was coming, I decided to keep my multi million dollar manufacturing business on Mare Island, even though it is not ideal for us.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

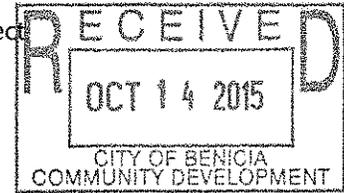

Sincerely,

Sara Wolfgang

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

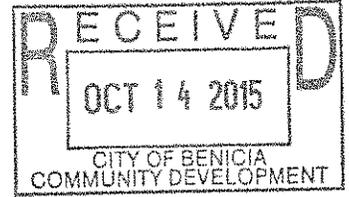

Sincerely,

Scott Bartlett

Dear Ms. Million,

If seems like insane behavior to even consider putting that many people and the environment in danger. We need to be saying YES to the new energies that are coming forth. We need to divest in oil and reinvest in the new renewable and non contaminating energies.

There is a new culture emerging.

Please be a part of it.  
Please be leaders of this emergence.

Protect the people.  
Protect nature and animals and plants and water.

It is time to change our conversations of the direction we are going.  
It is time to change our actions of the direction we are going.  
It is time to change our VALUES of the direction we are going.

Now is the Time...

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

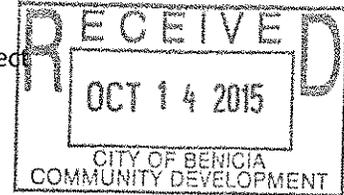

Sincerely,

Christine Fenlon

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train. My daughter owns a home in Benicia

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

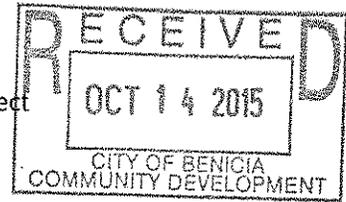

Sincerely,

Christine Anderson

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. **From:** Ronald Parsons, Sr <rparsons01@comcast.net>  
**Sent:** Monday, October 12, 2015 12:21 PM  
**To:** Amy Million  
**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm not only my community but yours too. Valero has already been discovered parking, of multi-car oil trains, at McClellan Park and transferring the oil to trucks to avoid detection and opposition to their operations.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways. We in Sacramento have experienced the effects of railroad hazardous cargos, i.e., military bombs explosions.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate, realistic worst-case-scenario analysis that reflects existing data on recent spills, this project should not and cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

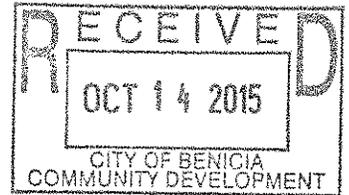

Sincerely,

Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

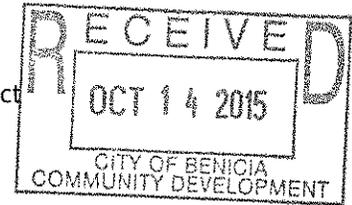

Sincerely,

Rick and Sharon Norlund

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

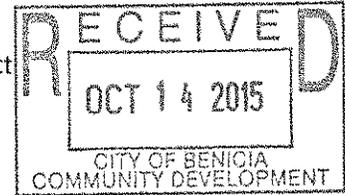

Sincerely,

Kelly Tuttle

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

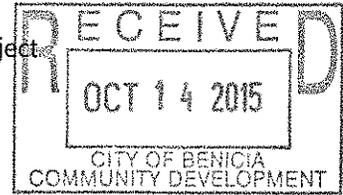

Sincerely,

Anita Pereira

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

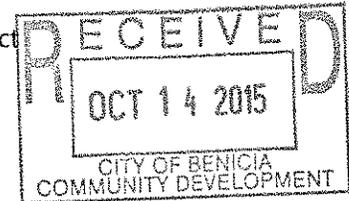

Sincerely,

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

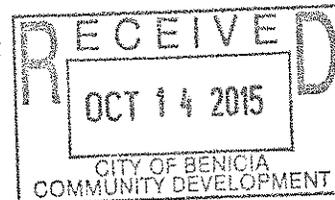

Sincerely,

Rika Ishii-Price  
109 Smith Road  
CA, CA 94507

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

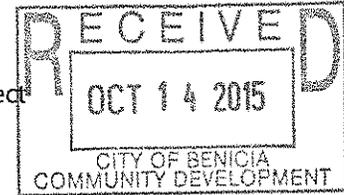

Sincerely,

Michael Sarabia

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

I live in Martinez, just across the water from Benicia and am VERY concerned about the negative aspects of this terrible idea.

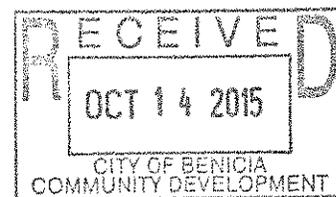

Sincerely,
