For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

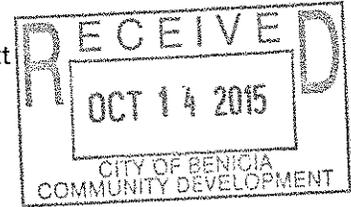

Sincerely,

Charlene Fershin

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

I and other family members have asthma, and we want cleaner air, not dirtier air! Also, in recent years we've heard of disastrous oil train fires, such as in Quebec, where fracked oil makes a more incendiary disaster than regular oil, killing many people and wrecking the environment, and polluting the air.

I remember accidents in the Roseville rail yards, with long-buried munitions exploding, and munitions trains putting the community in danger, and evacuations taking place. It was awhile back, but the principle is the same. I remember one of these incidents was in the spring of '73 or '74, and one of the cellists in the Youth Symphony I was in had to borrow a cello for our concert, because her family had evacuated suddenly and she left her cello behind at home. That incident was big news at the time.

Let it be a cautionary tale that you take to heart. An ounce of prevention is worth a pound of cure!

My husband lived in Benicia for awhile during the early '70's. I remember the most notable features of the area were the big tanks and pipes at oil refineries, rather smelly, at least that was the view from the highway. I believe it's time for areas that concentrate on the oil and gas industry to stop putting their eggs in one basket, phase out fossil fuels, and turn to clean, safe, sustainable energy sources instead, that won't hurt the planet. This is inevitable, anyway, so why wait til things are desperate? Better to start now and embrace the wave of the future. Better to be visionary than short-sighted. California usually leads the way in innovation. You can be part of that. Thank you.

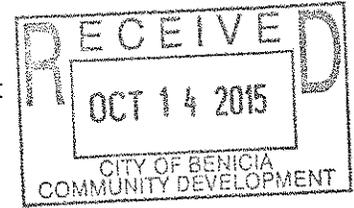

Sincerely,

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

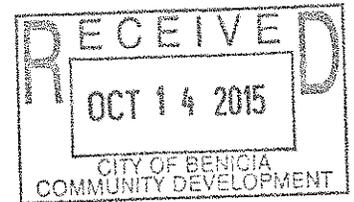

Sincerely,

Greg DeMasi

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

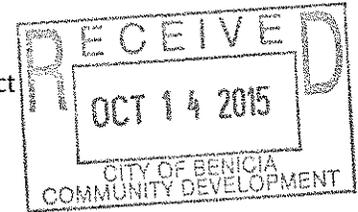

Sincerely,

Chris Evans

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

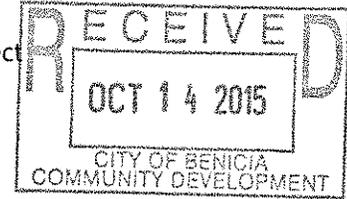

Sincerely,

CRYSTAL A MOURAD  
650 Manzanita Ave #106

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

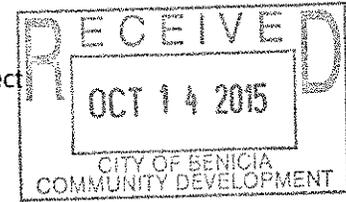

Sincerely,

lisa phenix

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

Having enjoyed a wonderful honeymoon in Benicia with my wife in 2010, today I am writing with serious concern about Valero's proposed oil train offloading facility there. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

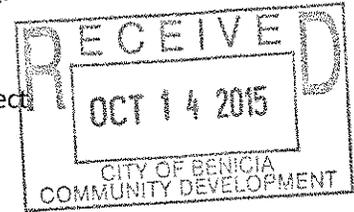

Sincerely,

Robert Jump

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

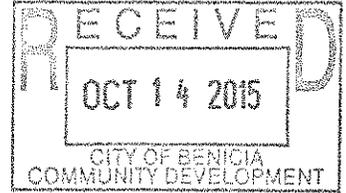

Sincerely,

Suzanne Newman

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

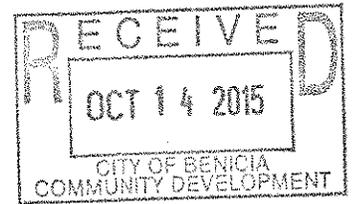

Sincerely,

Caroline Steele  
10213 Adam Ave  
CA, CA 95945

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

Corporations are not capable of making decisions on behalf of America's Citizenry! I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

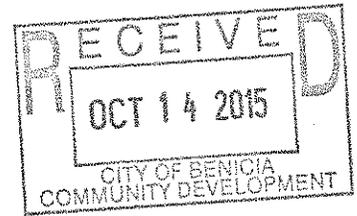

Sincerely,

Susan King

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

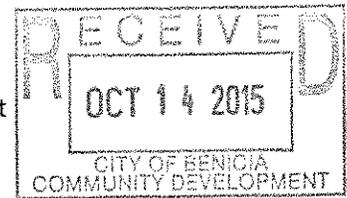

Sincerely,

dee simmons

I have read that the Bakken oil fields have already passed their prime. I think it is foolish to make this huge investment in a short-lived resource, not to mention that California is trying to move to renewable energy. What about the impact on Suisun Marsh and the Delta if there's a wreck? Have we spent more than 30 years protecting them to keep our salmon industry and Delta agriculture going, only to lose the whole thing in one wreck?

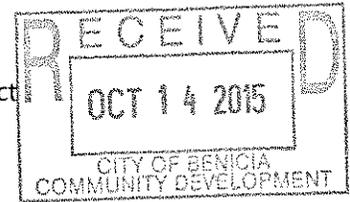

Sincerely,

Lesley Hunt

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

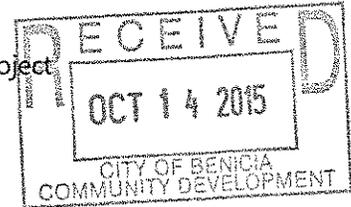

Sincerely,

Teri Barnato  
24980 Ben Taylor Rd  
Colfax, CA 95713

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

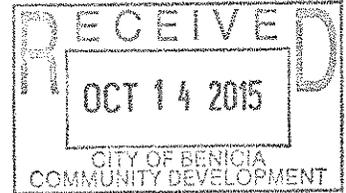

Sincerely,

Bob Atwood

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

In addition, the financial liability in cases of catastrophic accidents like these will without question fall back in large part on the taxpayers in the State of California and our local communities. Corporations may be people as far as the Supreme Court is concerned, but these "people" find many and various ways to avoid their responsibilities by declaring bankruptcy and shielding assets when the day to pay comes due.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

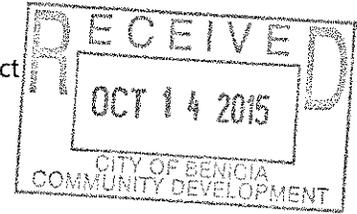

Sincerely,

Connie Day

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

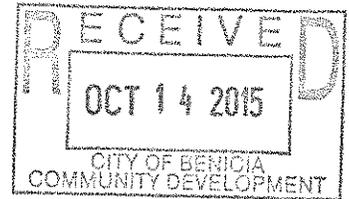

Sincerely,

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

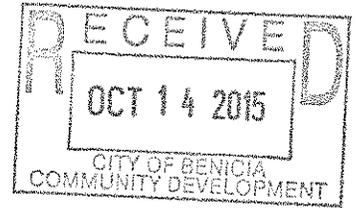

Sincerely,

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

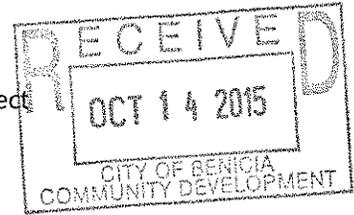

Sincerely,

Jeanne Shelsky

**To:** Amy Million  
**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

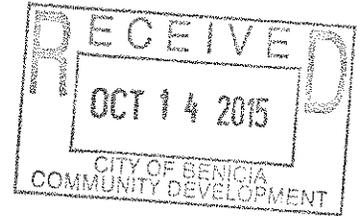

Sincerely,

Janet Soderstrom

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

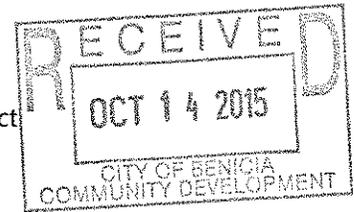

Sincerely,

Cheryl Reynolds

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

As a neighbor in Vallejo, I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

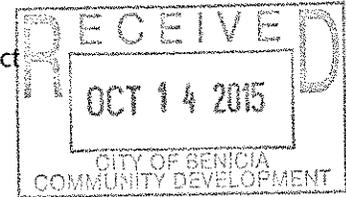

Sincerely,

Lana Touchstone

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

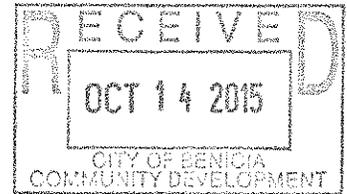

Sincerely,

Judi Ambrosius

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. **From:** Angie Williams <ace3@joimail.com>  
**Sent:** Monday, October 12, 2015 7:36 PM  
**To:** Amy Million  
**Subject:** RE: Public comment on Valero crude-by-rail project

Principal Planner, Benicia Community Development Department Amy Million,

Dear Mrs. Million,

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

Sincerely,

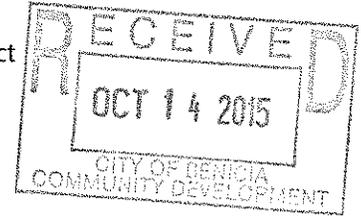

Angie Williams  
36132 road 222  
Wishon, California 93669

Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

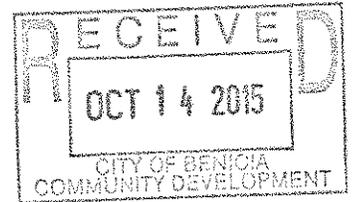

Sincerely,

Jerry Peavy

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

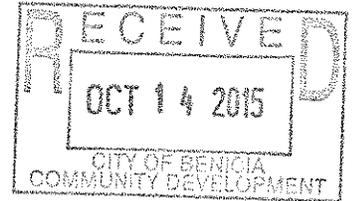

Sincerely,

Sage Weidenbenner

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

I grew up in Antioch and still have relatives in the area. Isn't it enough that this whole area is known as 'cancer corridor'? Please reject this proposal.

Sincerely,

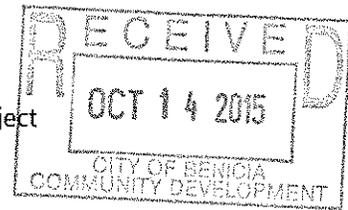

Cheryl Fischer

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

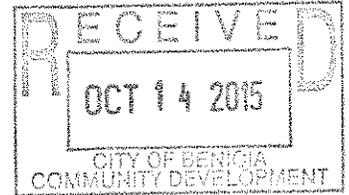

Sincerely,

Katherine Harper  
1377 Chestnut St,  
Chico, CA 95928

**Sent:** Monday, October 12, 2015 10:06 PM  
**To:** Amy Million  
**Subject:** RE: Public comment on Valero crude-by-rail project

Principal Planner, Benicia Community Development Department Amy Million,

Dear Mrs. Million,

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

Sincerely,

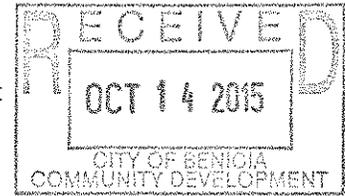

Charlotte Hughes  
1334 6th St NE  
Minneapolis, Minnesota 55413

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

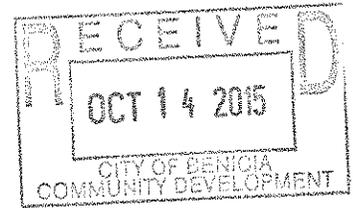

Sincerely,

NICHELLE LEE  
1200 NORVELL STREET  
EL CERRITO, CA 94530

**To:** Amy Million  
**Subject:** Protect Our Communities and Derail Valero!

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report, this project would create several significant and unavoidable impacts, that could harm my community. Bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, and sulfur dioxide among others, plus fine particulate matter. Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each or 4,500 per train. According to the EIR the cumulative risk of spills, explosions, and fires along the Union Pacific mainline, would be significant for all of the tank cars, including the yet-to-be-built DOT-117 cars which require a puncture resistance of only 18 miles per hour even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage, and contamination of our precious wetlands!

The Environmental Impact Report also wrongly assumes that a worst case scenario is a spill of 'only' approximately 240,000 gallons.

The train that incinerated Lac-Mégantic, Quebec in July 2013, spilled more than 1.6 million gallons of crude and similar accidents in West Virginia, Alabama, and North Dakota have also resulted in 20 or more tanker cars catching fire so without an accurate worst-case-scenario analysis that reflects existing data on recent spills this project cannot be approved. The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by within our children's lifetimes.

At a time of extreme drought and intense heat waves we must invest in safe & clean energy rather than more and more dangerous oil infrastructure. Finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in Environmental-Protection-Agency-designated environmental-justice communities -- primarily low-income and of color.

Approving this project will only add to a legacy of environmental injustice, and is racism pure & simple.

For all these reasons, I urge you & the planning commission, as well as the city council to deny certification for this imperfect Environmental Impact Report and reject Valero's latest proposed oil train terminal!

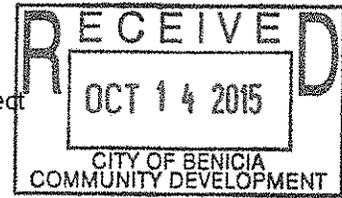

Sincerely,

m Dandicat

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

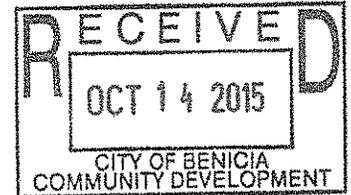

Sincerely,

Sakura Vesely

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

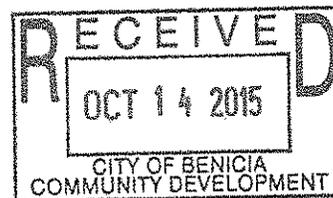

Sincerely,

M E Gladis  
Oak Ave  
Davis, CA 95616

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

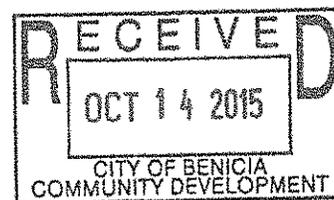

Sincerely,

Kristen Oliner

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm this community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

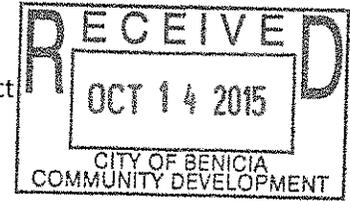

Sincerely,

Thomas Brustman

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I write with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create significant and unavoidable impacts that could harm our community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the environmental impact report identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

The cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For these and other reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

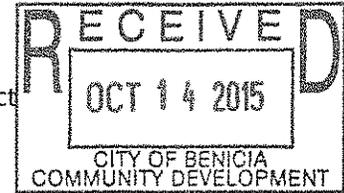

Sincerely,

Floyd O'Brien  
33 W Alder St  
Stockton, CA 95204

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

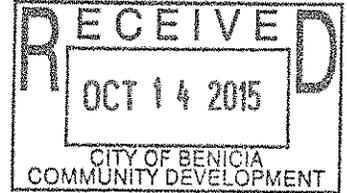

Sincerely,

Sheila Ward  
1057 Calle 8  
San Juan, PR 00927

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

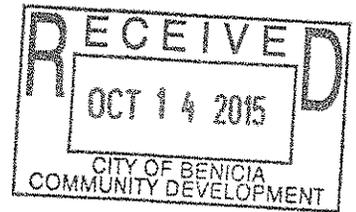

Sincerely,

Kirk Lumpkin

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

Sincerely,

ute trowell

Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

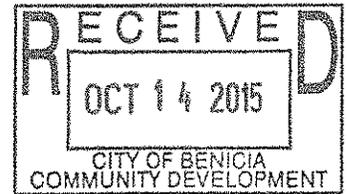

Sincerely,

Gemma Geluz

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

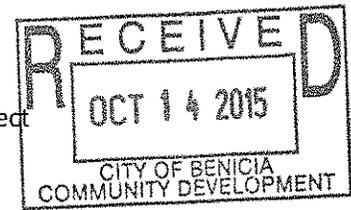

Sincerely,

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. **Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

If the DEIR does not address it, it should state if the project has any intention of using the new terminal to offload refined fuels and calculate the difference in greenhouse gas emissions that would be emitted between refining the fuel outside of the region vs in the region.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

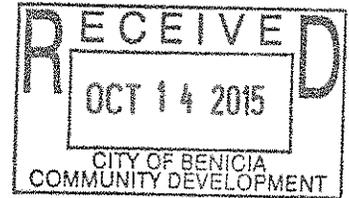

Sincerely,

Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

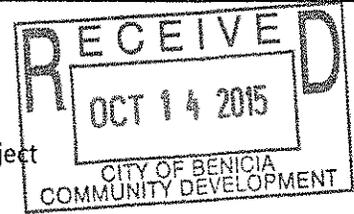

Sincerely,

DANIEL PARTLOW

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

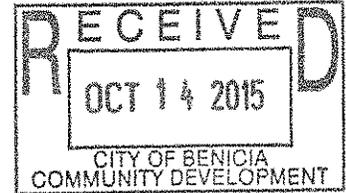

Sincerely,

Maeryn Boirionnach

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

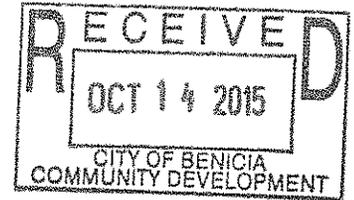

Sincerely,

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

If this project goes through, it will be hard to sell my house in Benicia (which I have owned 14 years) because who would want to live in a danger zone--I am in the evacuation area--the smell and the noise of the refinery are already troublesome--but why increase Benicia citizen's exposure to danger just to appease the refinery. What are they offering us for the exponentially greater risk we citizens of Benicia will be exposed to--and who will want to buy here. What about the others in the industrial park? Why should we knuckle under to the demands of Valero when all we get is empty reassurances from those who are employed by Valero. We will give away the store and get nothing in return for the vast liability and disadvantages--economically, safety-wise, and breathability of the atmosphere. We have no assurances or control of anything that goes on once this project is approved. To me it's insane to even be considering it. I didn't buy a house here expecting that the city would give away the store, so to speak, and make us all suffer. Valero's empty assurances are just that--just so they can make an extra profit, we are all subjected to dangers beyond the ones that they are describing because the railroads will be free to do whatever they want in whatever schedule they want and we're expected to sacrifice our homes, our health and the health and safety of our children--for the pittance that they donate. Valero has already received sizeable property tax cuts.

You on the planning department have the opportunity to make history and say "no" to this dangerous and ill-conceived project. Please, please think. You are all that is protecting us, the citizens of Benicia. They already have had tax cuts and they use a goodly portion of our water while we are expected to flush our toilets less often. To me it's unconscionable to expose citizens to increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

Please, please, think ahead and don't sell us down the river out of fear of Valero. Who will want to situate their business in the industrial park? I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

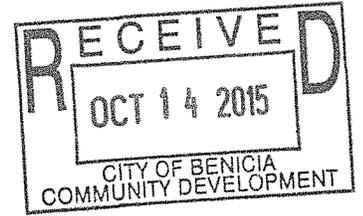

Sincerely,

Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

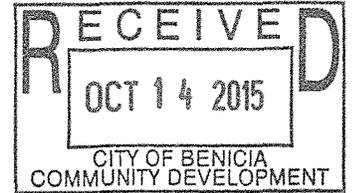

Sincerely,

Season Eckardt

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

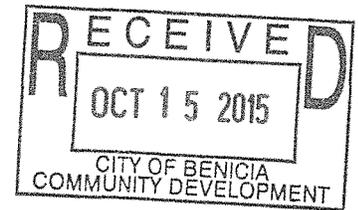

Sincerely,

Cindy Sprecher

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

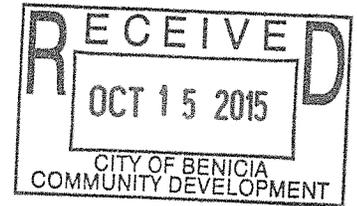

Sincerely,

Betsy Farmer

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

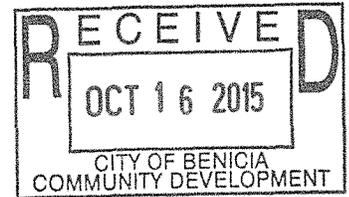

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

Sincerely,

Yashoda Jorda  
7921 Clinton St, apt. 4, Los Angeles, CA Los Angeles, CA 90048 US

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

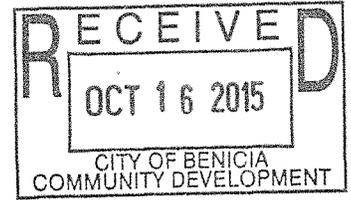

Sincerely,

Richard Spotts

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

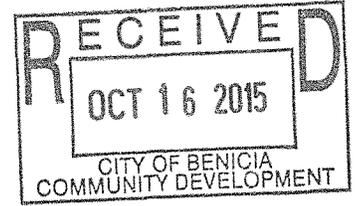

Sincerely,

Susana Soares

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. **Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

Dear Amy Million

I am using the following letter as a guide because it is well put and I could not do better research on my own. I would like to add two additional comments.. Basically, there is no way hundreds of miles of railroad tracks can be safe and maintained. There will always be the inevitable derailment, either here or along the way. Our air quality isn't great to start with, as you may already know, which is an additional problem. As a community do we really want to make things worse?

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

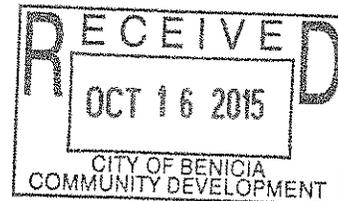

Sincerely,

Priscilla Whitehead  
288 West J St  
Benicia, CA 94510

**From:** Carol Blaney <clblaney@yahoo.com>  
**Sent:** Saturday, October 17, 2015 2:31 PM  
**To:** Amy Million  
**Subject:** RE: Public comment on Valero crude-by-rail project

Principal Planner, Benicia Community Development Department Amy Million,

Dear Mrs. Million,

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

Sincerely,

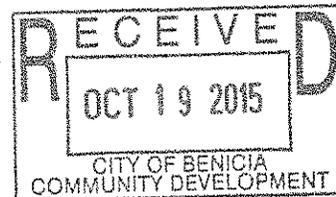

Carol Blaney  
P.O. Box 1706  
Redlands, California 92373

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

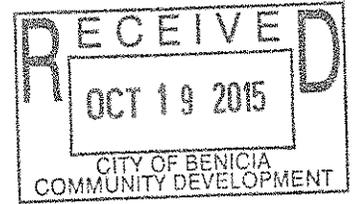

Sincerely,

Rhonda Kazmierski

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

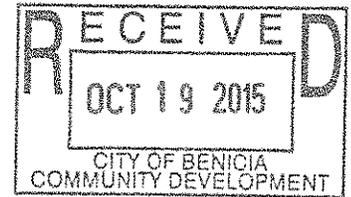

Sincerely,

Patricia Vazquez

**From:** Antoinette Gonzales <lolo.tonetone@yahoo.com>  
**Sent:** Monday, October 19, 2015 2:40 PM  
**To:** Amy Million  
**Subject:** RE: Public comment on Valero crude-by-rail project

Principal Planner, Benicia Community Development Department Amy Million,

Dear Mrs. Million,

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

Sincerely,

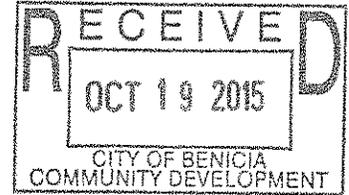

Antoinette Gonzales  
12669 Westbranch Way  
Victorville, California 92392

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

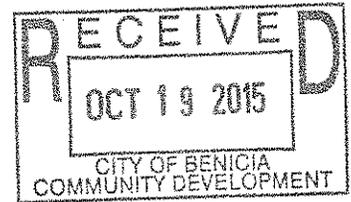

Sincerely,

Joan Scott

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

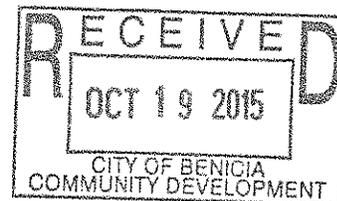

Sincerely,

Elyce Klein  
1840 Sonoma Ave

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing to oppose Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

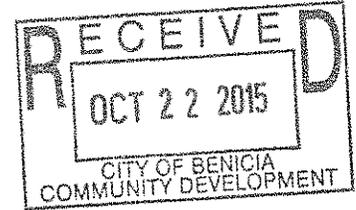

Sincerely,

Paula DeFelice

**To:** Amy Million  
**Subject:** Benicia oil trains

Ms. Amy Million, Benicia Community Development Department

Dear Ms. Million,

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate communities.

According to the Environmental Impact Report, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our wetlands and waterways. It would also create increases in toxic air pollution along the rail route. This level of risk is unacceptable.

The EIR also assumes the "worst case" scenario is a spill of eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects

existing data on recent spills. Without an accurate worst case scenario analysis, this project should not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities – primarily low-income and communities of color. Approving this project will add to a legacy of

environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

I do not live in the East Bay, but I have lived in the San Francisco Bay Area all my life and treasure this area.

Sincerely,

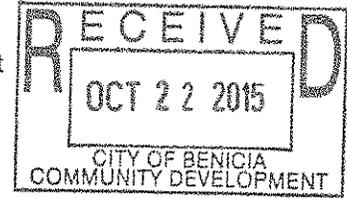

Ellen Sweeney

Boulder Creek, CA

**Subject:** RE: Public comment on Valero crude-by-rail project

Principal Planner, Benicia Community Development Department Amy Million,

Dear Mrs. Million,

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

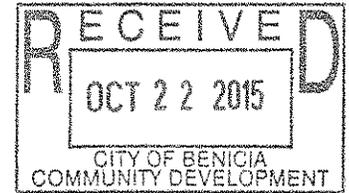

Sincerely,

Delayne Auerbach

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

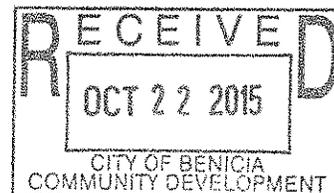

Sincerely,

Otmar Neuhoefler

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia. Also, please run all the right-wing know-nothings out of town.

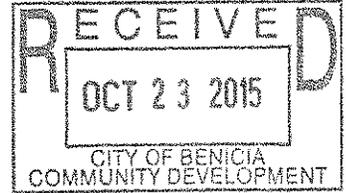

Sincerely,

Thomas Petersen  
798 Military East  
Benicia, CA 94510

**Sent:** Sunday, October 25, 2015 6:08 PM  
**To:** Amy Million  
**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am alarmed about Valero's proposed oil train offloading facility in Benicia. This would create a great increase in the number of oil trains running through the populous city of Sacramento. There is a great risk that one or more of these trains could explode, putting at risk 17 schools and over 13,000 students and staff within a mile of the railroad tracks. The train route also puts vital waterways at risk. These highly flammable and toxic oils have caused fiery explosions that cannot be put out so they must be left to burn out, polluting our air and causing untold harm to the health of individuals living in the affected community and to the environment itself.

According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community, not to mention communities outside of California which will be impacted by the shipment of Canadian tar sands oil and Bakken crude to the Valero site.

Bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways. Neither Valero nor the city of Benicia should have to right to inflict all this harm on other communities.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

The oil and rail industry contemplate trains with 100 to 150 tanker cars filled with toxic oil. Oil trains this long are inherently more likely to tip over because the sheer weight of the cars, particularly those toward the end of the train create a whipsaw effect that can bring the entire train down. How can you justify subjecting the lives of millions of people in the blast zone to incineration, not to mention loss of homes and other property.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

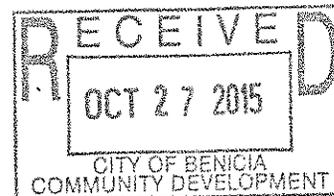

Sincerely,  
Jan Rein  
Sacramento, CA

**From:** Ernest Pacheco <erniepacheco@cwa9412.org>  
**Sent:** Sunday, October 25, 2015 7:18 PM  
**To:** Amy Million  
**Subject:** RE: Public comment on Valero crude-by-rail project

Principal Planner, Benicia Community Development Department Amy Million,

Dear Mrs. Million,

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

Sincerely,

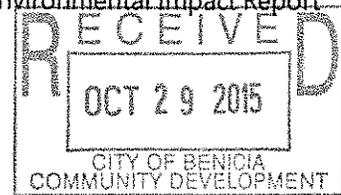

Ernest Pacheco  
22650 Main St  
Hayward, California 94541

**Subject:** Public comment on the Valero Recirculated Draft Environmental Impact Report

Dear Ms. Million,

I am a resident of Richmond, and I live in the impact zone of potential harm from a spill, explosion or fire caused by the shipment of crude by rail. I am writing to share my grave apprehensions regarding the proposed oil train offloading facility at the Benicia Valero refinery.

The environmental impact report (EIR) states that the facility would create "significant and unavoidable impacts." I would like to bring your attention to several issues that pose unacceptable dangers to residents, our local economy, and the environment.

The EIR says that the risk of spills, explosions and fires along the Union Pacific rail line "would be significant for all of the tank car designs," even the planned DOT-117 cars, which will still only require a puncture resistance of only 18 mph; in most areas, current speed limits are 50 mph. A single accident is likely to cause injuries and deaths, economic damage, and long-term contamination of waterways and wetlands.

The EIR assumes a worst-case scenario of a spill of eight tanker cars, roughly 240,000 gallons. However, a more likely accidental spill or fire may involve a far greater quantity. Accidents in West Virginia (in which 14 tanker cars derailed and exploded; neighbors likened the fireball to a scene from the apocalypse), Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Is this what we want to invite into our communities? More than 141 "unintentional releases" were reported from railroad tankers in 2014, an all-time high and a nearly six-fold increase over the average of 25 spills per year during the period from 1975 to 2012, according to records of the federal Pipeline and Hazardous Materials Safety Administration.

Moreover, the EIR predicts an unacceptable increase in toxic air pollution. If oil trains are brought into Benicia, those living along the rail route and near the refinery—many of whom already suffer from diesel and refinery-related health issues—will be exposed to increased levels of nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Most of these residents live in EPA-designated environmental-justice communities.

I am also gravely concerned about the "significant and unavoidable" climate impacts identified in the EIR. California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80

percent reduction of greenhouse gas emissions by 2050 is in direct contradiction with the increased GHGs that are produced by refining extreme crude. The urgency of our climate crisis compels us to move beyond dangerous oil infrastructure and invest in safe, clean energy.

I therefore urge the Planning Commission and City Council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

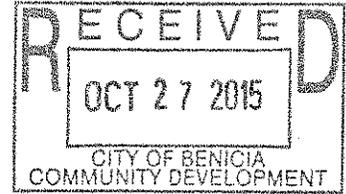

Thank you for your consideration.

Janet Scoll Johnson

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

the ignorance of men is the enemy of mama nature why is it that the most educated people commit the worst crimes against nature and humanity?

men has turn earth into a painful place for all living beings...when you do wrong nothing goes unpunished Stop the war against the environment by men I blame you for being cruel

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

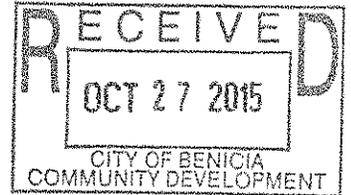

Sincerely,

nando a.

**From:** Cathleen Dorinson <cdorinson@hotmail.com>  
**Sent:** Monday, October 26, 2015 8:36 PM  
**To:** Amy Million  
**Subject:** RE: Public comment on Valero crude-by-rail project

Principal Planner, Benicia Community Development Department Amy Million,

Dear Mrs. Million,

I am writing to ask you to not allow Valero's proposed oil train offloading facility in Benicia to be built. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate the Benicia community.

It will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, the vast majority of people who will be impacted by this project live in primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

Please do not certify this EIR. And reject Valero's proposed oil train terminal in Benicia.

Sincerely,

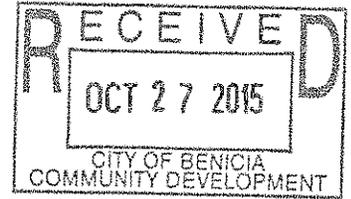

Cathleen Dorinson  
P O Box 267  
Point Reyes Station, Colorado 94956-0267

This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

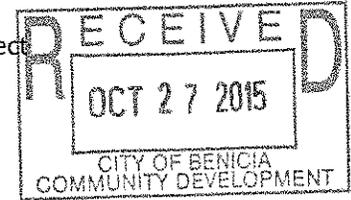

Sincerely,

Kathleen Maddox

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

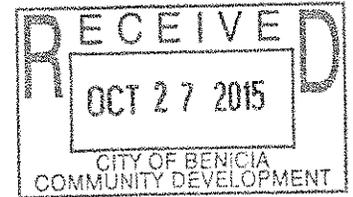

Sincerely,

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

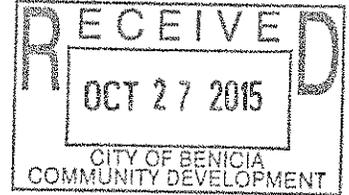

Sincerely,

Kimberly Wiley

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

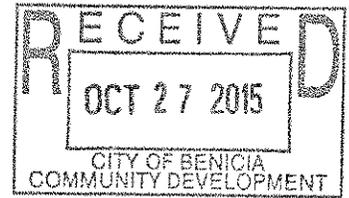

Sincerely,

N. Carey

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

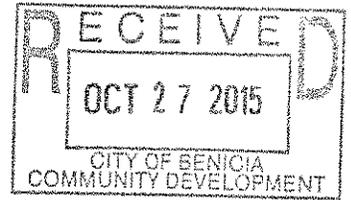

Sincerely,

Lesa Urban

**From:** Linda Lustig <slustig@yahoo.com>  
**Sent:** Monday, October 26, 2015 4:59 PM  
**To:** Amy Million  
**Subject:** RE: Public comment on Valero crude-by-rail project

Principal Planner, Benicia Community Development Department Amy Million,

Dear Mrs. Million,

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

Sincerely,

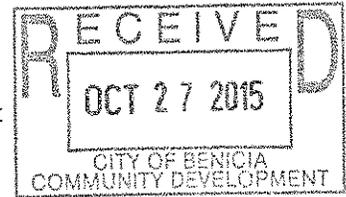

Linda Lustig  
2223 McGee Ave  
Berkeley, California 94703

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

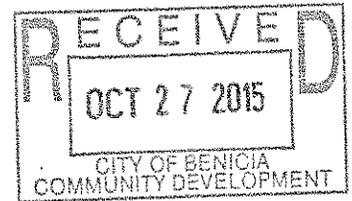

Sincerely,

Mary Alden

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I live in Rodeo, a neighbor to Benicia, and another town with a refinery. I am concerned overall about the switch in the crude oil input to include tar sands from Canada.

This is why I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

**To:** Amy Million  
**Subject:** RE: Public comment on Valero crude-by-rail project

Principal Planner, Benicia Community Development Department Amy Million,

Dear Mrs. Million,

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

Sincerely,

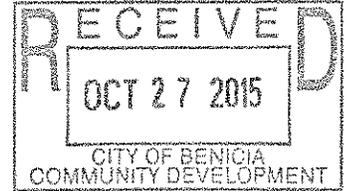

Barbara Gaman

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

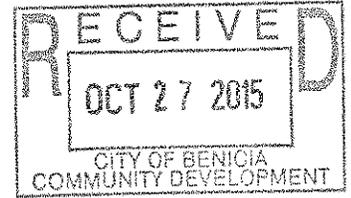

Sincerely,

Tammy Ashba

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

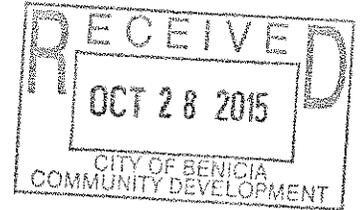

Sincerely,

gemini stone

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

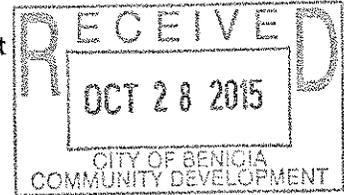

Sincerely,

Jan Davenport  
727 Driftwood Drive  
Suisun City, CA 94585

**To:** Amy Million  
**Subject:** RE: Public comment on Valero crude-by-rail project

Principal Planner, Benicia Community Development Department Amy Million,

Dear Mrs. Million,

I am writing to express deep concern over Valero's proposed oil train offloading facility in Benicia. According to the EIR, this project would create several "significant and unavoidable impacts" that could devastate my community.

Bringing oil trains into Benicia will create unacceptable increases in toxic air pollution for communities all along the rail route and near the refinery. The EIR identifies several significant and unavoidable air impacts from toxins and known carcinogens including increased pollution from NOx, sulfur dioxide, PM 2.5, and benzene.

According to the EIR, the cumulative risk of spills, explosions, and fires along the UPRR mainline "would be significant for all of the tank car designs," including the not-yet-built DOT-117 cars. Such a disaster could result in significant loss of life, long-term economic loss, and contamination of our precious wetlands and waterways. This level of risk is also unacceptable.

The EIR also assumes the "worst case" scenario is a spill of 8 tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Québec in July 2013 spilled over 1.6 million gallons of crude, or about 60 tanker cars. The EIR must assume a worst case scenario that reflects existing data on recent spills. Without an accurate worst case scenario analysis, this project can not be approved.

The revised EIR identifies "significant and unavoidable" climate impacts that conflict with California's existing climate law mandating the state move to an 80% reduction of greenhouse gas by 2050. At a time when wildfires are raging and the drought is more dire than ever, it is imperative we invest in safe, clean energy rather than extreme oil infrastructure.

In addition, analysis of census data demonstrates that a vast majority of people who will be impacted by this project live in EPA-designated environmental justice communities - primarily low-income and communities of color. Approving this project will only add to a legacy of environmental racism in communities living along the rail routes.

For all these reasons, I respectfully urge the Planning Commission and City Council to not certify this EIR and reject Valero's proposed oil train terminal in Benicia.

Sincerely,

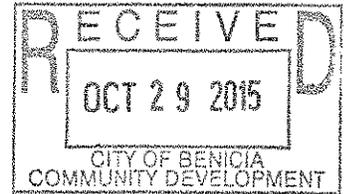

Lydia Houston

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

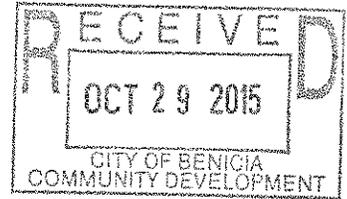

Sincerely,

Jeff Snell

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

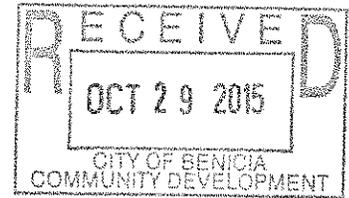

Sincerely,

Leslie Greaves

**Subject:** Protect Our Communities and Deny Valero's Rail Project

Dear Ms. Million,

I am writing with serious concern about Valero's proposed oil train offloading facility in Benicia. According to the environmental impact report (EIR), this project would create several "significant and unavoidable impacts" that could harm my community.

For one, bringing oil trains into Benicia is expected to create unacceptable increases in toxic air pollution to towns along the rail route and near the refinery. Specifically the EIR identifies increases in nitric oxide, nitrogen dioxide, sulfur dioxide, benzene and fine particulate matter (PM 2.5). Oil trains of this size typically have three diesel engines emitting the equivalent pollution of 1,500 cars each, or 4,500 per train.

According to the EIR, the cumulative risk of spills, explosions and fires along the Union Pacific mainline "would be significant for all of the tank car designs." This includes the not-yet-built DOT-117 cars, which require a puncture resistance of only 18 mph even while current speed limits are set to 50 mph in most areas. Just one accident could result in significant loss of life, long-term economic damage and contamination of our precious wetlands and waterways.

The EIR also wrongly assumes the "worst case" scenario is a spill of just eight tanker cars, or about 240,000 gallons. The train that incinerated Lac-Mégantic, Quebec in July 2013 spilled more than 1.6 million gallons of crude (about 60 tanker cars), and accidents in West Virginia, Alabama and North Dakota have also resulted in 20 or more tanker cars catching fire. Without an accurate worst-case-scenario analysis that reflects existing data on recent spills, this project cannot be approved.

The revised EIR also identifies "significant and unavoidable" climate impacts that conflict with California's existing law to reduce greenhouse gas pollution by 80 percent below 1990 levels and move to an 80 percent reduction of greenhouse gas emissions by 2050. At a time of extreme drought and intense heat waves, we must invest in safe, clean energy rather than dangerous oil infrastructure.

And finally, an analysis of census data has shown that a vast majority of people who will be harmed by this project live in EPA-designated environmental-justice communities -- primarily low-income and of color. Approving this project will only add to a legacy of environmental injustice.

For all these reasons, I urge you, the planning commission and city council to deny certification for this EIR and reject Valero's proposed oil train terminal in Benicia.

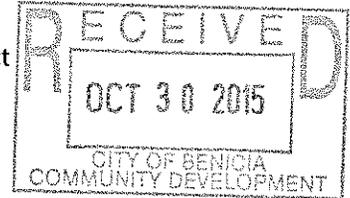

Sincerely,

Rosemary Rodriguez
